

Milady Chapter 10

KEY DEFINITIONS IN MILADY CHAPTER 10: DISORDER

Milady Chapter 10

Chapter 10: Disorders and Diseases
by Cohen & Tommy

UNDERSTANDING MILADY CHAPTER 10: A COMPLETE GUIDE TO NAIL DISORDERS AND DISEASES

For anyone pursuing a career in the nail technology or cosmetology industry, **Milady Chapter 10** represents a foundational pillar of professional knowledge. This chapter, found in the Milady Standard Cosmetology textbook, is devoted entirely to the study of nail disorders, nail diseases, and the overall health of the natural nail unit. Mastering the content of Milady Chapter 10 is not merely about passing a licensing exam; it is about developing the clinical eye necessary to distinguish between a healthy nail and one that may require medical attention. This article provides a comprehensive walkthrough of the core concepts within **Milady Chapter 10**, offering both students and seasoned professionals a valuable resource for understanding nail health, safety protocols, and client consultation best practices.

WHY MILADY CHAPTER 10 MATTERS IN COSMETOLOGY EDUCATION

The Milady Standard Cosmetology curriculum is the most widely used educational resource in the beauty industry across North America. **Milady Chapter 10** specifically addresses the anatomy, physiology, and pathology of the nail. The chapter equips future nail technicians with the skills to recognize conditions that are safe to work on and those that require a referral to a healthcare provider. Understanding this distinction is a matter of professional ethics and legal responsibility. When a technician comprehends the material in **Milady Chapter 10**, they can protect themselves, their clients, and their business from potential health risks and liability issues. This chapter also reinforces the importance of sanitation and infection control, which are critical components of any licensed salon practice.

THE ANATOMY OF THE NAIL UNIT: SETTING THE FOUNDATION

Before a student can effectively identify disorders, **Milady Chapter 10** first requires a solid grasp of the nail's anatomy. The nail unit is a complex structure comprised of several distinct parts, each with a specific function. The natural nail, also referred to as the onyx, is composed primarily of hardened keratin, the same protein found in hair and skin. The key anatomical components covered in **Milady Chapter 10** include the nail plate, the nail bed, the matrix, the cuticle, the eponychium, the perionychium, the hyponychium, and the nail folds.

The matrix, often called the mother of the nail, is the active tissue that generates new nail cells. If the matrix is damaged, it can lead to permanent nail deformity. The nail bed is the living tissue beneath the nail plate, and its rich blood supply gives the nail its pinkish color. The eponychium is the living skin that overlaps the nail plate at the base, while the cuticle is the non-living, translucent layer of skin that is typically removed during a manicure. By understanding these structures thoroughly from **Milady Chapter 10**, a technician can better understand how and why certain disorders develop.

VERSUS DISEASE

One of the most critical distinctions taught in **Milady Chapter 10** is the difference between a nail disorder and a nail disease. This terminology is essential for accurate communication and professional conduct. A nail disorder is typically a condition that is caused by an injury or an imbalance in the body. Disorders are often temporary and can sometimes be corrected with proper care or lifestyle changes. Common examples include brittle nails, hangnails, and ingrown nails.

A nail disease, on the other hand, is a condition that is caused by a pathogen, such as bacteria, fungi, or viruses. Nail diseases are often contagious and require medical treatment. **Milady Chapter 10** emphasizes that nail technicians are not licensed to diagnose or treat nail diseases. However, they must be able to recognize the signs and refuse service if necessary to prevent the spread of infection. This chapter serves as a critical guide for making those professional judgments.

COMMON NAIL DISORDERS COVERED IN MILADY CHAPTER 10

Milady Chapter 10 provides a detailed inventory of the most common nail disorders that a technician will encounter in the salon. Understanding these conditions allows a professional to offer appropriate service adjustments or recommendations.

Brittle Nails and Onychorrhexis

Brittle nails are a very common complaint, characterized by nails that split, peel, or break easily. When the nail plate has a series of lengthwise ridges, this condition is known as **onychorrhexis**. **Milady Chapter 10** teaches that these conditions can be caused by frequent exposure to water, harsh chemicals, nutritional deficiencies, or the natural aging process. Professional nail treatments that focus on hydration and the use of a nail strengthener can be beneficial for clients with brittle nails.

Hangnails and Their Causes

While the name suggests otherwise, a hangnail is not actually part of the nail plate. It is a small, torn piece of cuticle or skin around the nail. **Milady Chapter 10** identifies hangnails as a disorder resulting from dry skin, cuticle damage, or frequent hand washing. Hangnails can be painful and are prone to infection if not properly removed. A skilled technician, using the knowledge from **Milady Chapter 10**, can safely trim hangnails with sanitized cuticle nippers.

Ingrown Nails and Professional Boundaries

An ingrown nail, or onychocryptosis, occurs when the edge of the nail plate grows into the surrounding skin, leading to pain, redness, and swelling. **Milady Chapter 10** clearly outlines the

scope of practice for nail technicians regarding ingrown nails. While a technician can place a cotton wick under the free edge to gently lift the nail plate, they are not permitted to cut the nail plate down the side or to pierce the skin. Severe or infected ingrown nails must be referred to a podiatrist or medical doctor.

NAIL DISEASES DESCRIBED IN MILADY CHAPTER 10

The section on nail diseases in **Milady Chapter 10** is perhaps the most important for safety and legal reasons. Nail diseases are often caused by infectious microorganisms and can spread rapidly in a salon environment if proper sanitation protocols are not followed.

Onychomycosis: The Fungal Infection

Onychomycosis is the medical term for a fungal infection of the nail. This is one of the most common nail diseases discussed in **Milady Chapter 10**. It can affect the nail plate, the nail bed, or both. The signs of onychomycosis include thickened nails, yellow or brown discoloration, debris buildup under the nail, and a distorted nail shape. **Milady Chapter 10** stresses that nail technicians cannot treat this condition, and any client presenting with an active fungal infection should be refused service and referred to a dermatologist.

Paronychia: The Bacterial Infection

Paronychia is a bacterial or fungal infection of the skin surrounding the nail, specifically the perionychium. It is characterized by redness, swelling, and pus formation. **Milady Chapter 10** identifies this as a condition that requires immediate medical attention. A technician should never work on a client with an active case of paronychia, as the manipulation of the infected area can worsen the condition and spread the infection.

Pseudomonas Aeruginosa and Green Nails

Pseudomonas aeruginosa is a type of bacteria that thrives in warm, moist environments, making it a common concern in the nail industry. When this bacteria grows between the natural nail plate and an artificial nail enhancement, it can cause a green or green-black discoloration. **Milady Chapter 10** explains that this is not a fungal infection, but a bacterial one. The condition usually resolves once the nail plate is allowed to dry out completely. Technicians should remove the enhancement, sanitize the nail, and allow the natural nail to breathe.

NAIL IRREGULARITIES AND THEIR INDICATIONS

Beyond specific disorders and diseases, **Milady Chapter 10** also covers various nail irregularities that can be indicators of overall health. While a nail technician is not a doctor, being observant of these signs can help clients seek appropriate medical care when needed.

Pitting of the Nail Plate

Nail pitting appears as small, pinpoint depressions on the surface of the nail plate. According to **Milady Chapter 10**, this condition is often associated with psoriasis, an autoimmune skin condition. It can also be linked to alopecia areata. Pitting is not contagious, but it is a cosmetic concern for many clients.

Pincer Nails and Trumpet Nails

Pincer nails, also known as trumpet nails, are a condition where the nail plate curves inward from both sides, creating a pinched or rolled appearance. **Milady Chapter 10** describes this as a disorder that can be hereditary or caused by improper grooming. This condition can be painful and may require special nail filing techniques to reduce discomfort.

Koilonychia: Spoon Nails

Koilonychia is a condition in which the nail plate becomes thin and concave, forming a spoon-like shape. **Milady Chapter 10** notes that this irregularity is often associated with iron deficiency anemia. Clients with spoon nails should be encouraged to consult with a medical professional to investigate potential underlying health issues.

CLIENT CONSULTATION AND MILADY CHAPTER 10

A thorough client consultation is the first line of defense against spreading infections and mishandling nail conditions. **Milady Chapter 10** teaches that a consultation should always include a visual examination of the client's hands and nails. The technician should ask about any visible concerns, changes in nail health, or recent injuries. If the technician suspects a nail disease based on the knowledge gained from **Milady Chapter 10**, they must tactfully decline service and recommend a doctor.

It is also important to document the condition of the client's nails before beginning a service. This protects both the technician and the client. If a client has a minor disorder, such as dry cuticles or brittle nails, the technician can tailor the service to address these issues using products and techniques learned in conjunction with **Milady Chapter 10**.

SANITATION AND INFECTION CONTROL: THE PRACTICAL APPLICATION

Milady Chapter 10 is deeply connected to the earlier chapters in the textbook that cover sanitation and infection control. Recognizing a nail disorder or disease is only half the battle; a technician must also know how to prevent cross-contamination in the salon. All metal implements must be properly sterilized in an autoclave. Non-porous surfaces must be disinfected with an EPA-registered hospital-grade disinfectant. Disposable items, such as buffers, orangewood sticks, and nail files, should be discarded after a single use, especially when working with a client who has a known nail condition.

The knowledge from **Milady Chapter 10** reinforces why these sanitation practices are non-negotiable. A salon that neglects proper sanitation is a breeding ground for the very nail diseases described in the chapter, such as onychomycosis and *pseudomonas*. By adhering to the standards set forth in the Milady curriculum, professionals maintain a safe and hygienic environment for everyone.

HOW TO PREPARE FOR THE MILADY CHAPTER 10 EXAM

For students currently studying, preparing for the exam on **Milady Chapter 10** requires a combination of memorization and applied understanding. Here are some study tips based on the content of the chapter:

- **Use flashcards:** Create flashcards for each term, including the definition, cause, and whether it is a disorder or a disease.
- **Practice identification:** Look at images of nail conditions and practice naming them. Visual recognition is a key skill tested in state board exams.

- **Understand the scope of practice:** Know exactly what a nail technician can and cannot do for each condition mentioned in **Milady Chapter 10**.
- **Connect the chapters:** Relate the information in this chapter to the chapters on anatomy, chemistry, and sanitation for a holistic understanding.
- **Review frequently:** The terminology in **Milady Chapter 10** is very specific. Regular review is necessary to retain the information.

APPLYING MILADY CHAPTER 10 KNOWLEDGE IN THE REAL WORLD
